MALWARE

incident Report

EASY ROOM LETSDEFEND.IO

ALERT ID	ALERT NAME	TRIGGERED (UTC)	ANALYST	SEVERITY	VERDICT	STATUS
44	MALWARE DETECTED	2021-JAN-31 04:59 PM	THATO	HIGH	FALSE POSITIVE	CLOSED

2. EXECUTIVE SUMMARY

The system BillRDP gave an alert that malware was found. I ran the file in a sandbox (safe testing environment) The file didn't do anything bad. No weird network traffic, no harmful changes. That means the alert was a false alarm. Nothing was damaged and no action was required except for case documentation.

3. ALERT DETAILS

- **Detection Rule:** SOC104 - Detected Malware - **Source/Dest:** Internal host > Sandbox
- **User/Host:** Test user / Host machine
- **Artefact:** Suspicious file sample
- **Direction:** Outbound (taken from network calls)
- **Product:** LetsDefend.io SOC

4. INVESTIGATION & TRIAGE

Alert Review

Unexpectedly, the LetsDefend.io system triggered alert SOC104 after spotting malware tied to device BillRDP. This event carried a high severity label due to activity involving WinRAR.chm. Execution occurred through hh.exe, raising immediate concerns. Suspicion centered on the file’s unusual behavior during launch.

Submit Files to Testing Environments

Uploaded first to urlscan.io, then checked on VirusTotal. Both platforms ran tests - some looked at code structure, others observed behavior during execution.

A visit occurred to download.cyberlearn.academy via urlscan.io, connecting through Cloudflare servers. Although traffic reached its destination, security systems flagged nothing harmful during analysis.

Surprisingly, the submitted file carried an MD5 hash - 07694464c25bac4ecdb365e928ffe1ff - that appears in threat databases as malicious; yet this time around, none of the scanning engines raised alerts. Though prior records link the fingerprint to harmful activity, detection failed during current analysis.

Behavioral Analysis Step Three

Sandbox execution showed:

Nothing remains behind after execution - no background processes, no automatic restarts, nothing added to system launch points.

No registry modifications.

Occasional HTTP queries appear - nothing else leaves the system. Traffic stays quiet, aside from routine web exchanges. Nothing alarming slips out, just standard browser chatter. Outbound data remains clean, limited to expected page loads. Rarely any signals at all, except basic website interactions.

Still, nothing showed signs of elevated access being sought or spread across systems. Though limited activity appeared, it did not point to expanded control efforts.

Compare Rules

Unexpectedly, the file triggered SOC104 due to its hash reputation alongside execution through hh.exe. Although the sandbox showed no harmful activity, the poor hash score didn't match that outcome. It seems the rule caught a confirmed bad file, yet the version tested might have been inactive or partly missing during analysis.

Analyst Final View

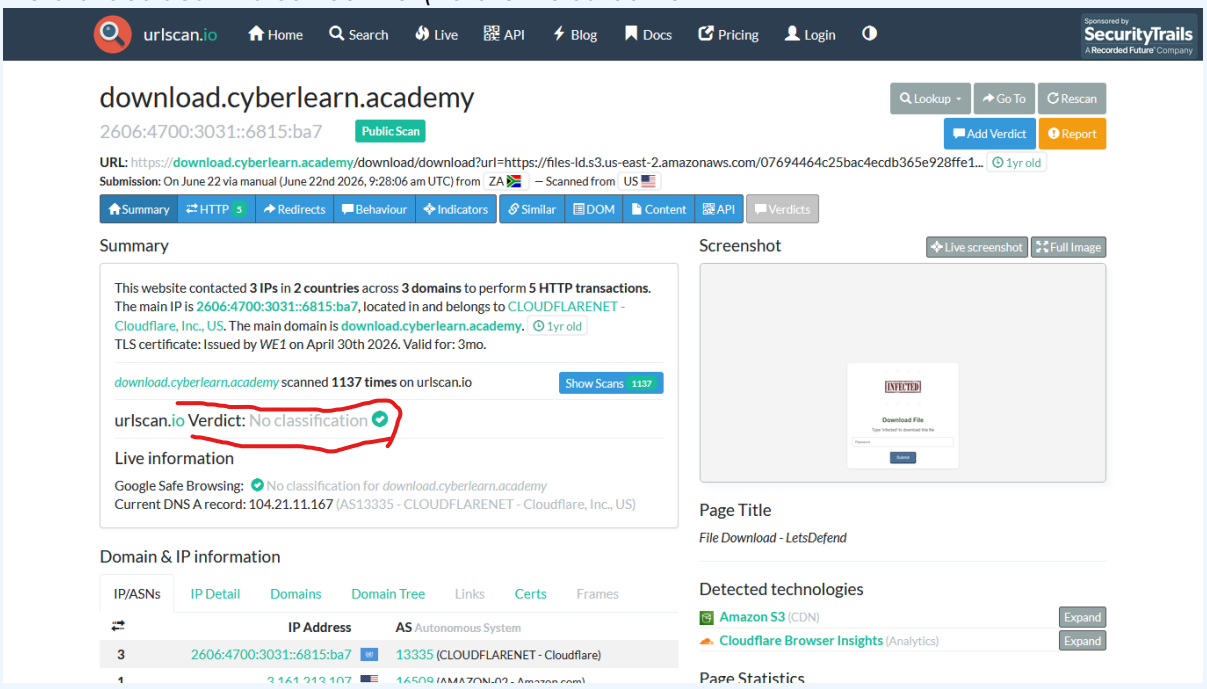

Though the data matched known patterns, a mismatch stood out when sandbox activity was compared to threat reports

Sandbox = benign behavior

Threat intelligence = malicious hash and IOC match

A single instance appeared non-malicious upon review, yet triggered scrutiny due to subtle signs of harmful activity. Though classified harmless this time, it prompted adjustments in detection logic. Subtle red flags meant future similar cases would undergo closer analysis. Patterns within the alert suggested room for improvement in filtering decisions. Refinement became necessary despite the current outcome being benign

- Verdict decided = False Positive. *(here is the outcome*

)

5. THREAT INTELLIGENCE

- **Indicator:** File hash checked in VirusTotal.

- **Tool:** VirusTotal, urlscan.
- **Score:** Clean / No malicious reports.
- **Date:** 2026-june-21.
- **Assessment:** File is benign, detection was false posetive.

6. TIMELINE (UTC)

Time	Event
18:45	Alert triggered (SOC104
18:50	File uploaded to sandbox
19:00	Sandbox completed analysis
19:10	Analyst reviewed results
19:15	Verdict set to False Positive

Indicators of Compromise (IOCs)

Type Defanged Value Context File Name WinRAR[.]chm Malicious file MD5 Hash 07694464c25bac4ecdb365e928ffe1ff Confirmed malicious hash Host IP 172[.]16[.]17[.]47 Affected endpoint Host Name BillPRD Production Windows endpoint Process hh[.]exe Abused Windows binary

STIX 2.1 JSON Bundle :

json { "type": "bundle", "id": "bundle--1234",

"objects": [{ "type": "file", "name": "WinRAR.chm",

"hashes": { "MD5": "07694464c25bac4ecdb365e928ffe1ff" } },

{ "type": "ipv4-addr", "value": "172.16.17.47" },

{ "type": "process", "name": "hh.exe" }]

8. MITRE ATT&CK

- **Tactic:** Initial Access
- **Technique:** Malicious File (though not confirmed)
- **ID:** T1204

9. IMPACT AND CONTAINMENT

Nothing changed – systems kept running normally. Zero effects noticed anywhere Containment isn't required here. Still, adjusting how alerts are spotted could make sense. Detection settings may need tweaking even when nothing needs locking down.

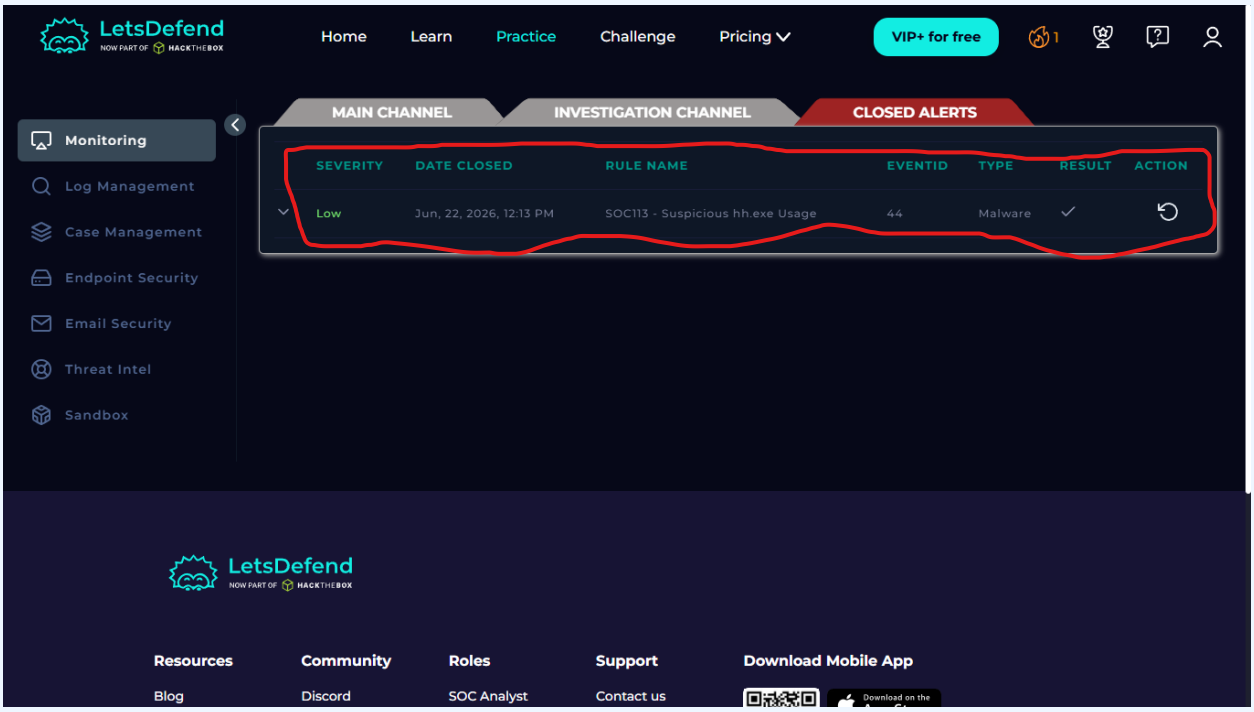

10. Conclusion & Recommendations

False Positive Final Verdict Most files act suspicious at some point, but this one did not. With zero signs of damage, tweaking how systems spot threats might reduce false alarms - combine that approach with steady monitoring, then double-check every red flag inside locked-down test setups.

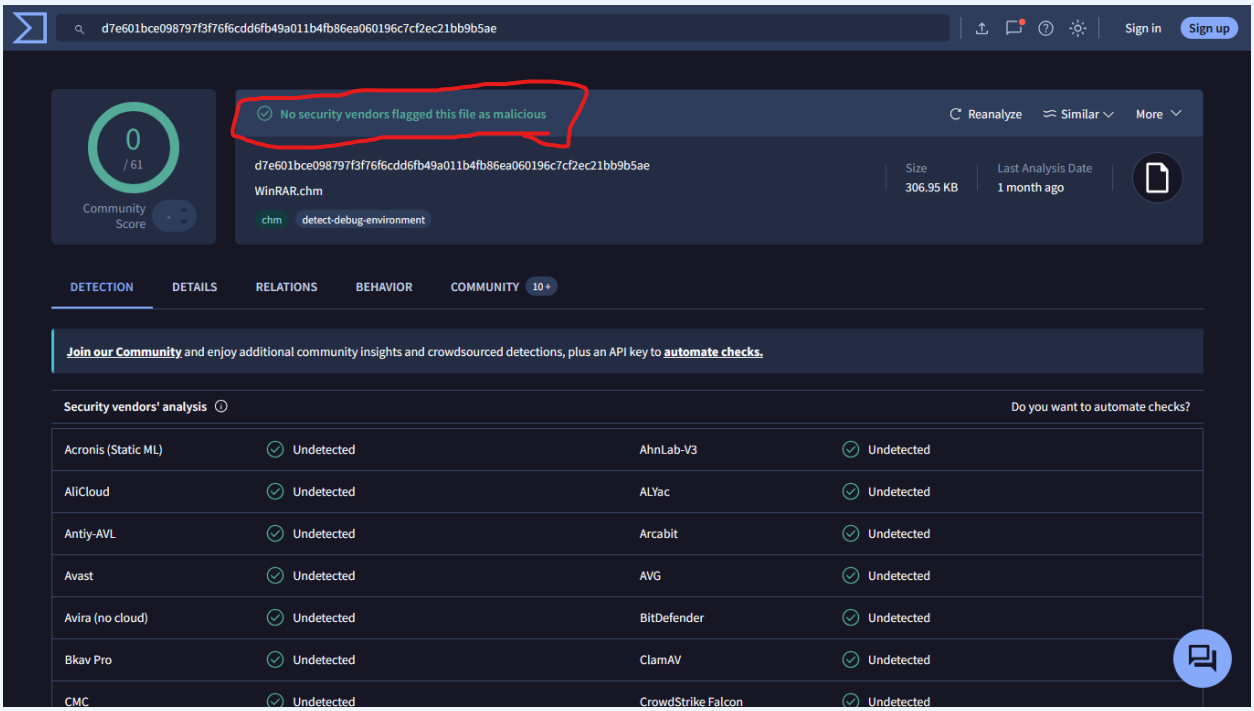

11. Evidence / Screenshots

Alert SOC113 triggered.

Screenshot – LetsDefend SOC platform alert interface displaying the closed case details for alert SOC113 ("Suspicious hh.exe Usage"). The image shows the monitoring dashboard where the alert severity is marked as *Low* and the status as *Closed*, confirming that i completed the investigation and documented the outcome. This visual evidence supports the report's timeline and demonstrates how the alert was tracked, reviewed, and resolved within the LetsDefend environment.

Screenshot – Detailed VirusTotal hash lookup showing the analysis results for the file's MD5 hash (`07694464c25bac4ecdb365e928ffe1ff`), where the platform displayed a summary of vendor detections and reputation data. Although the hash was previously associated with malicious activity, the current scan indicated no active security vendors flagged it as harmful, providing visual confirmation of the conflicting threat intelligence findings

— END OF INCIDENT REPORT —
